Excel Number Formats

- Apply number formats such as dates, currency, or fractions to cells in a worksheet.
- For example, if you're working on your quarterly budget, you can use the Currency number format so your numbers represent money. Or, if you have a column of dates, you can specify that you want the dates to appear as March 14, 2012, 14-Mar-12, or 3/14.

- Follow these steps to format numbers:
- Select the cells containing the numbers you need to format.
- Select CTRL+1.
- In the window that displays, select the **Number** tab (skip this step if you're using Microsoft 365 for the web).
- Select a **Category** option, and then select specific formatting changes on the right.
